

Microsoft datacenters in Austria

As more people and businesses rely upon technology to stay connected, informed, and productive, digital needs in Austria and around the globe are growing. And that means the need for hyperscale datacenters is growing too.

Hyperscale brings hyper efficiency. Microsoft cloud services offer customers an energy efficient and carbon neutral alternative to running their own private datacenters. [Research](#) shows that Microsoft cloud services are up to 93 percent more energy efficient than traditional enterprise datacenters.

Microsoft strives to empower the communities where our employees live, work, and operate our datacenters. With that, it's important we share information to ensure you understand why datacenters are needed, Microsoft's approach for responsible operations, and the benefits of hosting a datacenter in your community.

Published June 2022. This document shares information we have as of the publication date, and it includes estimated information and projections. The information is provided as-is and may change without notice.

The cloud powers our digital world

Cloud computing is the delivery of computing services over the internet. Common daily activities are made possible through cloud computing, such as:

Email

Online banking

File storage

Streaming videos

Collaboration

Online shopping

Mobile apps

Cloud computing can provide consumers and businesses with the benefits of enhanced security, privacy, compliance protection, lower costs, easier access, higher reliability, and a lower carbon footprint.

The Microsoft Cloud is for everyone

The Microsoft Cloud serves over 1 billion customers and 20 million companies worldwide.

Organizations in Austria relying on the Microsoft Cloud are made up of a variety of sectors, such as large enterprises, startups, governments, hospitals, banks, schools, or other organizations that contribute to a modern society.

When Microsoft joins a community, we bring our commitments for a better world

Support inclusive economic opportunity

Commit to a sustainable future

Earn trust

Microsoft datacenters are key to our sustainability goals

Carbon negative by 2030

[Power usage effectiveness \(PUE\)](#) measures cloud energy efficiency. The calculation is total power consumption divided by IT power consumption. A lower PUE score indicates more energy-efficient datacenters, with a PUE of 1.0 being the best score. Our Austrian datacenters are under construction and not in operation. They will have a **design average PUE of 1.12**.

Globally, Microsoft datacenters use fossil fuel generators for backup power and account for **less than 1 percent of our overall emissions**.

[Leadership in Energy and Environmental Design \(LEED\)](#) is the world's largest green building certification program. LEED provides the framework for healthy, highly efficient, and cost-saving green buildings with lower carbon emissions. LEED certification is a globally recognized symbol of sustainability achievement and leadership. **New Microsoft datacenters being built are designed to earn LEED Gold certification.**

Microsoft operations in Austria **comply with applicable air quality requirements**.

Water positive by 2030

[Water usage effectiveness \(WUE\)](#) is another key metric relating to the efficient and sustainable operations of our datacenters and is a crucial aspect as we work towards our commitment to be water positive by 2030. WUE is calculated by dividing the number of liters of water used for humidification and cooling by the total annual amount of power (measured in kWh) needed to operate our datacenter IT equipment.

Microsoft will use outdoor air with direct evaporative cooling at Austria datacenters. This method of cooling **uses outside air and zero water** for cooling when temperatures are below 29.4 degrees Celsius, reducing water for cooling to less than 3 percent of the year. This system is highly efficient, using less electricity and a fraction of water used by other water-based cooling systems, such as cooling towers.

The new datacenters in Austria are designed for an **average WUE of 0.023 L/kWh**.

Zero waste by 2030

Microsoft has a goal to achieve 90 percent diversion of datacenter operational waste by 2030. To reach this goal, we're

working closely with our waste haulers to optimize waste diversion programs across our global datacenter portfolio. We have achieved Zero Waste certifications for our San Antonio, Texas; Quincy, Washington; Boydton, Virginia; and Dublin, Ireland datacenter locations.

In 2020, we opened our **first Microsoft Circular Center in our North Holland datacenters**, which is designed to extend the life cycle of servers through reuse and to support a circular economy for the Microsoft Cloud. It takes five to six years from when a datacenter is operational to generate reusable assets; once the new datacenters are in use and servers are ready to be decommissioned, we plan to use the closest available Circular Center. Microsoft Circular Centers are able to process 3,000 servers per month for reuse.

Globally, Microsoft datacenters reuse **78 percent of our end-of-life assets and components; the remaining 22 percent of materials are recycled**. Additionally, Microsoft is conducting research and development to improve waste diversion by determining new recycling solutions for used air filters and fiber optic cables.

Microsoft is helping to build digital skills in Austria

ETC (Enterprise Training Center): Microsoft Austria has launched the [Microsoft Skills Campus](#), a training initiative to support upskilling for workers in Austria. Partnering with the ETC, Microsoft Austria brings together companies that are looking for qualified IT professionals and people who want to become such. Microsoft also is developing a basic training course to impart modern cloud knowledge to job seekers as well as employees. The participants learn the skills that are needed to secure the competitiveness and digital future of the Austrian economy.

Female Founders Austria: Female Founders provides guidance, resources, and mentors to female entrepreneurs to encourage diversity in entrepreneurship and drive impact for society and the economy. Microsoft is partnering with Female Founders on two core activities to create long-lasting impact. For the startup accelerator Grow F, Microsoft and Female Founders will scout for female-led startups in sustainability. One will be selected to join the upcoming cohort and be guided by experts from Microsoft Austria. Also, Microsoft will be one of the main partners of "Lead today. Shape tomorrow," the flagship leadership event for women in tech and innovation, establishing Vienna as the main hub for female entrepreneurship in Europe.

Microsoft datacenters create family-wage operations and construction jobs as well as positive impacts to the local economy

Microsoft datacenters represent a capital-intensive investment and long-term commitment to the community. More than **20 full-time employees** and contractors will work across our datacenter campuses in Austria.

When construction begins for the new facilities, we estimate it will require **127** construction roles and approximately **520,000 work hours** to complete the new datacenters. We intend to fill **25 to 30 percent of positions with local contractors**. Once the first datacenter is operational, we anticipate an initial **30** full-time employees will work at that facility. As more datacenter buildings are completed, additional employee teams will be hired.

Construction jobs

- Electricians
- Plumbers and pipefitters
- Carpenters
- Structural iron and steel workers
- Concrete workers
- Earth movers

Datacenter operations

- Campus management
- People management
- Critical environment operations
- Learning and development
- IT operations
- Mechanical engineers
- Electrical engineers
- Security contractors
- Building maintenance
