

Microsoft datacenters in Mexico

As we build and operate datacenters, we aim to address local challenges and create benefits for communities.

Our commitment is reflected in three key areas: advancing community prosperity, contributing to a sustainable future, and being a good neighbor through responsible operations.

Published October 2025. This document shares information we have as of the publication date, and it includes estimated information and projections. The information is provided as is and may change without notice.

About

We currently operate one datacenter and are building two new facilities in Querétaro.

Jobs

We expect construction of the two new datacenters to require approximately 9 million work hours and more than 2,200 jobs at peak activity.

Investments

Last year, Microsoft community investments supported 4 community identified projects in Querétaro.

Water

Facilities in Mexico are built with direct evaporative cooling. These datacenters will use water for cooling less than 15% of the year.

Living near a datacenter

Our practices include noise and light reduction, ecological restoration, and ensuring suppliers comply with local laws and environmental regulations.

Jobs

We partner with local suppliers and create well-paid construction and datacenter operations jobs.

Microsoft operates one datacenter and is building two new facilities in Querétaro.

- As of 2025, our facility currently employs approximately 64 people.
- We expect construction of the two new datacenters to require approximately 9 million work hours and more than 2,200 jobs at peak activity.

Datacenter operations jobs

- Campus management
- People management
- Learning and development
- IT operations
- Mechanical engineers
- Electrical engineers
- Security contractors
- Building maintenance
- Critical environments

Construction jobs

- Electricians
- Plumbers and pipefitters
- Carpenters
- Structural iron and steel workers
- Concrete workers
- Earth movers

Advancing community prosperity and well-being

Our datacenters increase local economic activity, create jobs, and boost tax revenue, benefiting residents and the community.

Taxes and economic impact

Microsoft datacenters represent a capital-intensive investment and long-term commitment to the community.

Communities around the world can typically anticipate significant economic benefits in combined local output, employment income, and public revenue contributions—from a single large-scale datacenter.

- Local economies benefit through significant investments in land, construction, and infrastructure.
- Local businesses are supported through sourcing materials and services from nearby vendors and contractors.
- Operational activities—such as purchases from local businesses and utility usage—generate economic output and tax revenue.
- A datacenter presence can serve as a catalyst for technology sector growth, attracting startups, spurring innovation, and creating new job opportunities.

Community investments

Working with local partners, we invest in programs that reflect community priorities—from digital skills and sustainability to community empowerment—and use our strengths as a technology company.

Last year, Microsoft's community investments supported four locally identified projects in Mexico, including:

- Plaza Galeras rehabilitation project
- Querétaro tree planting project
- Querétaro cybersecurity and AI trainings project
- Entrepreneurship Training Ciudad Colon

CyC Mobile Classroom

Microsoft collaborated with Construyendo y Creciendo (CyC) to offer primary and secondary education as well as technical certifications and literacy courses to construction workers and their families.

- The program provides mobile classrooms at CyC's construction sites and two neighborhoods of Querétaro and in Esperanza, municipality of Colón.
- In Colón and Marques, an itinerant instructor visits schools and organizations to teach technological skills including AI.

Contributing to a sustainable future

Our datacenters are designed for high efficiency, using less energy and water than traditional enterprise facilities.

Energy

- We've committed to achieving 100% renewable energy coverage globally by 2025.
- Our datacenters in Mexico will be designed for our backup generators to use a renewable biofuel that reduces net carbon emissions.

Water

- Our facilities in Mexico will be built with direct evaporative cooling.
- These datacenters will use water for cooling less than 15% of the year.
- In Mexico, Microsoft purchases water from private wells. On warm days when the temperature exceeds 85°F (29.4°C), water flows into the facility and cycles through the cooling system between 2–5 times. A portion of the water evaporates, while the remainder is typically discharged back to the local wastewater treatment plant in compliance with local regulations.
- We work with local utilities to ensure the community has ample water resources. We have made financial investments in water infrastructure across the globe, replacing and extending decades-old facilities that benefit local residents. These investments also pave the way for community growth.
- To learn more, visit the [datacenter water consumption fact sheet](#).

Waste

- In 2020, as part of our goal to become zero waste by 2030, we set a target of reusing or recycling 90% of our end-of-life assets globally.
- We reached a 90.9% reuse and recycling rate in 2024. Microsoft Circular Centers—which process decommissioned servers and cloud hardware—were a key part of that success.

Operating responsibly as a good neighbor

Each datacenter has a unique design, where the environment, community, and safety are prioritized.

Living near a datacenter

Vegetative screening and building setbacks will be included where possible and in accordance with local ordinances.

Unlike distribution warehouses, datacenters do not generate constant truck traffic. Deliveries are infrequent. Each building typically supports around 50 employees working in shifts across 24 hours, resulting in minimal parking lot traffic. Employee arrivals and departures are also staggered to avoid large shift changes.

The main sources of sound at datacenters include employee vehicles, occasional truck deliveries, backup generators, and HVAC equipment. Building setbacks help minimize the noise from backup generators and HVAC equipment.

Exterior lighting will be strategically placed around buildings, parking lots, roadways, sidewalks, and perimeter fencing. Fixtures are designed to direct light downward, ensuring security while minimizing light pollution.

During construction Microsoft's general contractors will comply with local noise ordinances and specifications outlined in the permitting process.

The community will be informed of permitted work hours and other updates through the [Microsoft in your community](#) blog.
